

QA TEST SUMMARY REPORT

Project: Web Application Quality Assessment (Sample – OpenCart Platform)

Prepared By: Nilava Pal – Senior QA Automation Engineer

Experience: 10+ Years in Software Testing (Manual & Automation)

1. Objective

Evaluate the stability, usability, and functional behaviour of the web application by testing core workflows and identifying defects that may affect user experience or system reliability.

2. Scope of Testing

- User Authentication (Login / Account Access)
 - Product Browsing and Shopping Cart Operations
 - Core User Workflow Validation
 - API Response Validation
 - Error Handling and Edge Case Scenarios
-

3. Testing Approach

Testing was performed using a combination of **functional testing, exploratory testing, and API verification** to validate key user journeys.

Tools Used

- Selenium WebDriver
 - REST Assured / Postman
 - Browser DevTools
 - Structured Bug Reporting
-

4. Sample Issues Identified

Issue 1 – Security Concern

Account lock is not enforced after multiple failed login attempts.

Impact: Potential brute-force vulnerability.

Issue 2 – Functional Issue

Cart total not updating after item removal.

Impact: Incorrect order summary displayed.

Issue 3 – API Error

API returns HTTP 500 when optional field is empty.

Impact: Backend validation issue.

5. Recommendations

- Implement a proper login attempt lock mechanism
- Improve UI state synchronisation for cart updates
- Enhance backend validation for optional API parameters

6. Conclusion

The application shows functional stability across core workflows, but improvements in **security validation, UI synchronisation, and API error handling** will enhance overall product reliability and user experience.
